RESULT AND CONCLUSION

RESULT

The IoT-based Hospital Monitoring Bed for Patients was designed to monitor the patient's health parameters continuously using sensors. The system collects patient data such as body temperature, heart rate, and other vital signs, depending on the sensors used. The collected data is processed by a microcontroller and can be displayed on a monitoring dashboard or mobile device. If any monitored parameter crosses a predefined threshold, the system can generate an alert for medical staff. This system helps improve patient monitoring, reduces the need for continuous manual checking, and supports timely medical assistance.

CONCLUSION

The IoT-based Hospital Monitoring Bed is a useful solution for improving patient care in hospitals. It combines sensors, a microcontroller, and IoT technology to monitor the patient's health in real time. The system helps doctors and nurses observe patient conditions more efficiently and respond quickly when abnormal readings are detected. It can reduce the workload of healthcare staff and improve monitoring efficiency. In the future, the system can be enhanced by adding more health sensors, automatic emergency notifications, cloud data storage, and AI-based health analysis. Thus, this project demonstrates how IoT technology can make hospital patient monitoring smarter, safer, and more efficient.
